b) sile u štapovima  $S_2$ ,  $S_3$  i  $S_4$  metodom Culmanna, a u štapovima  $S_{14}$ ,  $S_{15}$  i  $S_{16}$  metodom Rittera.

### b1) Metoda Culmanna

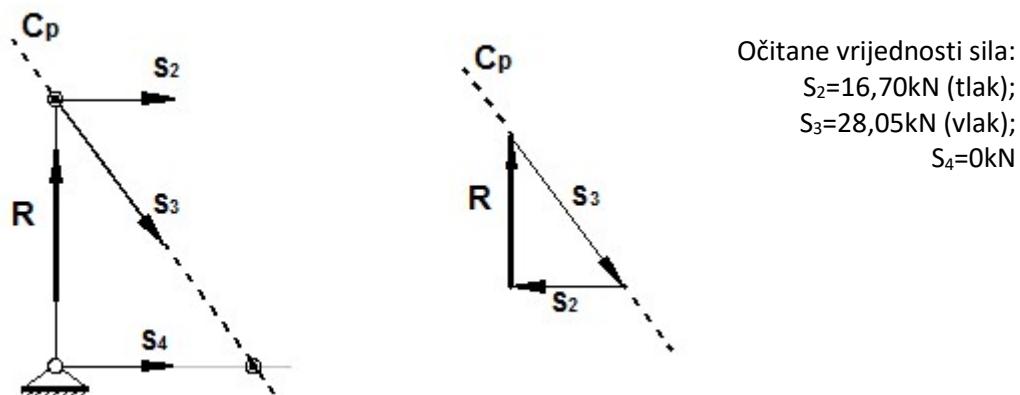

#### - Položaj rezultante

Za skicirani isječak rešetke (za određivanje sila u presjeku) tražimo vrijednost i položaj rezultante sila pomoću verižnog poligona. U ovom slučaju kada su obje djelujuće sile na jednom istom pravcu nije potrebno raditi verižni poligon jer se rezultanta sila nalazi na pravcu postojećih sila.

#### - Culmannov pravac

Culmannov pravac određen je dvjema točkama. Prva točka je sjecište rezultante sila i bilo kojeg pravca nepoznatih sila ( $S_2$ ). Druga točka je mjesto gdje se sijeku preostala dva pravca sila zadanih presjeka ( $S_3$  i  $S_4$ ). Spajanjem prve i druge točke dobivamo Culmannov pravac  $C_p$ .

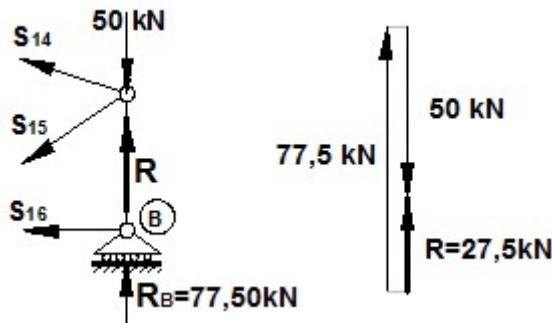

#### - Određivanje vrijednosti sila u označenim štapovima rešetke

Na Culmannov pravac prvo nanesemo rezultantu, a zatim силу која се среће са rezultantom у првој тоčки ( $S_2$ ) и то с исте стране Culmannovog првца. С друге стране Culmannovog првца наносе се првци сила из друге точке (у овом случају само првак сила  $S_3$ ). Очитавају се vrijedности сила и предznaci prema правилу ravnoteže sila (zatvoren krug sila).

## b2) Metoda Rittera

### - Položaj rezultante

Za skicirani isječak rešetke (za zadani presjek) tražimo vrijednost i položaj rezultante sila pomoću verižnog poligona. S obzirom da obje sile na isječku djeluju na jednom istom pravcu nije potrebno raditi verižni poligon jer se rezultanta sila nalazi na pravcu postojećih sila.

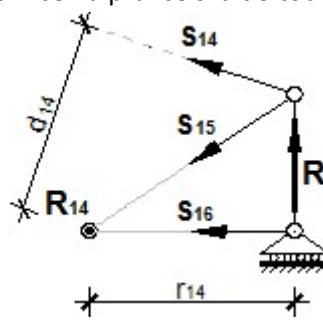

### - Položaj ritterovih točaka i određivanje nepoznatih sila u presjeku

Za pravac sile  $S_{14}$  ritterova točka se nalazi na sjecištu preostala dva pravca sila u presjeku  $S_{15}$  i  $S_{16}$  (da bi ostala samo jedna nepoznanica  $S_{14}$  koja se rješava pomoću uvjeta ravnoteže  $\sum M_{R14}=0$ ). Zatim se očitava udaljenost  $d_{14}$  između ritterove točke i nepoznate sile  $S_{14}$ , i udaljenost  $r_{14}$  između ritterove točke i rezultante  $R$ . Udaljenosti se određuju kao okomice na pravce sila do točke  $R_{14}$ .

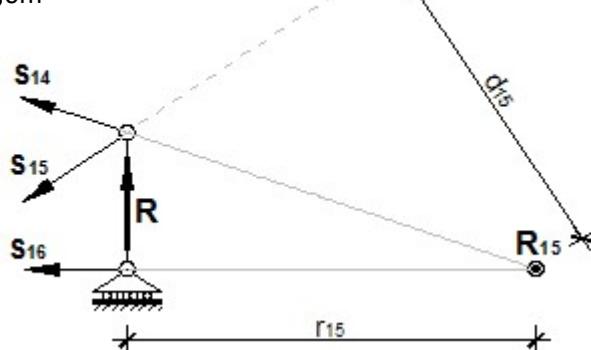

Očitane udaljenosti:  $d_{14}=2,85\text{m}$ ;  $r_{14}=3,0\text{m}$

$$\begin{aligned}\sum M_{R14} &= 0 \quad + \\ R \cdot r_{14} + S_{14} \cdot d_{14} &= 0 \\ S_{14} &= -28,95\text{kN} \quad (\text{tlak})\end{aligned}$$

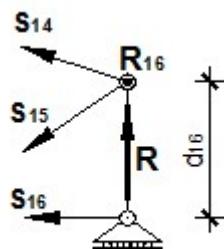

Očitane udaljenosti:  $d_{15}=5,0\text{m}$ ;  $r_{15}=6,0\text{m}$

$$\begin{aligned}\sum M_{R15} &= 0 \quad + \\ -R \cdot r_{15} + S_{15} \cdot d_{15} &= 0 \\ S_{15} &= 33,0\text{kN} \quad (\text{vlak})\end{aligned}$$

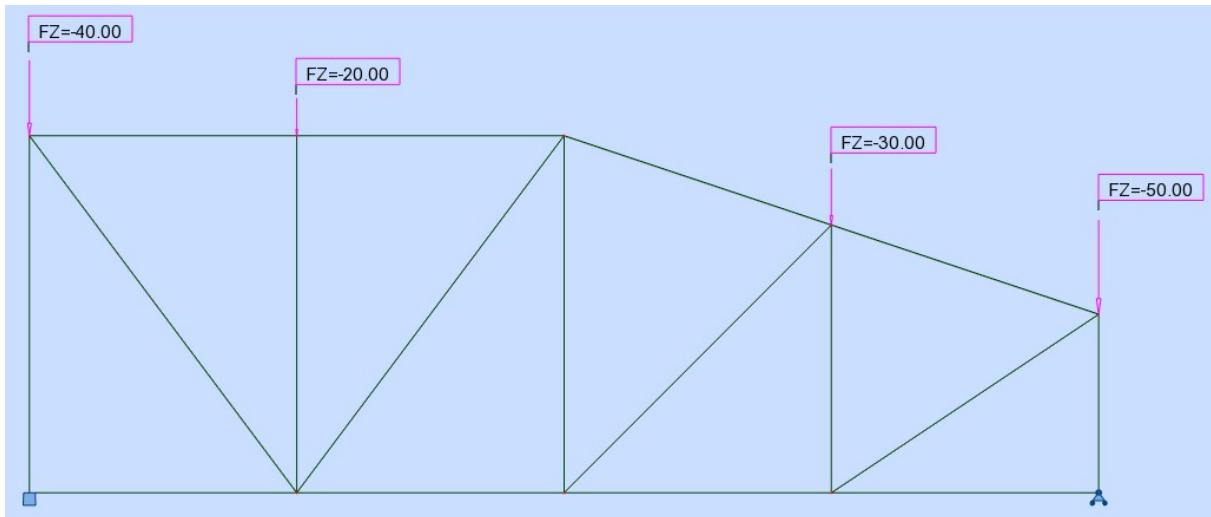

Očitane udaljenosti:  $d_{16}=2,0\text{m}$ ;  $r_{16}=0,0\text{m}$

$$\begin{aligned}\sum M_{R16} &= 0 \quad + \\ R \cdot r_{16} - S_{16} \cdot d_{16} &= 0 \\ S_{16} &= 0,0\text{kN}\end{aligned}$$
